

Split Fill Solution

The split fill solution is designed to help you achieve the best possible outcome from your specialty treatment—all while reducing waste and achieving cost savings.

The side effects often associated with the included medications are a cause for early medication discontinuation. In these cases, any unused medication cannot be returned to pharmacies and is therefore discarded and wasted. The goal of a split-fill program is to reduce or eliminate such waste. Under a split-fill program, pharmacies may only dispense a partial supply of certain medications for one month until tolerance is established.

How it works

- You will receive a two-week supply of your medication at half the standard copay.
- The program lasts for 28-30 days, or two prescription fills. Going forward, you will receive the usual supply at the standard copay.

Drugs in scope*

Drugs limited to 14-day supplies based on package size

- Afinitor (everlimus)

Drugs limited to a 15-day supply based on package size

- Gleevec (imatinib)
